WHOOPING COUGH MORBIDITY

EDMONTON, 1932 - 1952

This disease has been characterized by a high peak of incidence every third year until Sauer-type vaccine was introduced in 1942. Since that time these peaks are markedly lowered and are further apart. This has occurred during a period of rapid increase and overcrowding in our population.

Annual Report of the Medical Officer of Health

Chairman and Members
Local Board of Health
Edmonton, Alberta

Ladies and Gentlemen:

Following is a report of the activities of our Board and certain other health agencies of our City during 1952:

BIRTHS:

Resident births numbered 5,748, an increase of 693 over the previous year. The birth-rate increased by 2.2 per 1,000 population. This would appear to reflect reasonable prosperity and the influx of younger parents to our City, as the local marriage rate has declined 3 per thousand population during the past five years.

DEATHS:

The general death-rate showed little change. It is notable, however, that deaths from tuberculosis have been reduced by 70 percent during the past five years. This is a credit to the Provincial Tuberculosis Division and to the Alberta Tuberculosis Association. Pneumonia deaths have been reduced by 37 percent in the same period. Infant mortality gave a slight increase, but still remains among the lowest. The death-rate from all accidents, including suicide, remained the same as in the previous year. Deaths from automobile accidents, however, were increased by 21.9 percent.

COMMUNICABLE DISEASES:

Communicable diseases showed a marked reduction from 1951. For the third year in succession, a single case of diphtheria has prevented us from having a perfect year in this respect. An epidemic of poliomyelitis attacked our population more lightly than that in many parts of our province. However, 95 cases and 7 deaths were reported from this disease in our City. It no longer conforms with the name of "Infantile Paralysis", for 34 of these cases and 3 of the 7 deaths were over twenty years of age. Whooping cough, our most serious common communicable disease at present, continued its downward trend.

CLINICS:

Our immunization clinic, with an attendance of 19,928 for the year, has been a popular and valuable service. That diphtheria has practically disappeared from our community, with whooping cough following it into the class of rare diseases, is largely due to the activities of this clinic.

Supervision of feedings and physical development of children in our well baby and pre-school clinic has brought a grateful response from many mothers. Their appreciation is indicated by an attendance of 14,851 at this clinic. The clinic nurses made 2,216 home visits where further assistance and advice was indicated.

SCHOOL HEALTH SERVICES:

Administration of public and separate school medical services was assumed by this Board on April 1st, 1952. A full-time health officer, two nurses and a dental hygienist were added to this service during the year. The Board of Health also assumed the cost of furnishing medical rooms in all new schools, of which eight were under construction during the year. We have appreciated the courteous consideration of School Boards and staff personnel of the school services. With their continued co-operation we feel confident that we shall develop a school medical service second to none in its practical value to the physical and mental health of our school children.

SANITATION:

The continued rapid increase of our population presents a multiplicity of problems for our sanitary officers. Unhappily, a very extensive building of homes still leaves us with much overcrowding of dwelling space in our City, and a not inconsiderable portion of this accommodation would not be tolerated if any better alternative offered. It is to be hoped that Federal, Provincial and Municipal governments may work out more adequate plans for reasonably low-cost housing. This problem intimately concerns the health and happiness of many of our citizens. Sanitation of the food-handling establishments in our City has reached a higher standard than has ever before been achieved, as evidenced by the results of more than 1,000 bacteriological tests made. Constant analyses of water and milk supplies are carried out. Water samples are examined daily in laboratories at the water plant, the University, and our own department. Examination of over 10,000 milk samples in our own laboratory, and frequent inspection of 482 dairy farms, as well as pasteurizing plants, gives considerable assurance of the purity of this essential food product. Our veterinarian condemned 50,230 pounds of diseased meats during the year.

GENERAL:

Council set aside funds for construction of an urgently needed combined immunization and well-baby and pre-school clinic for South Edmonton at a total cost of \$55,000. Federal and Provincial governments have contributed \$22,292.00 toward this project. This clinic will open in April, 1953 and will be a very great convenience to mothers on the South Side.

Provincial and Federal grants also contributed \$45,000 toward the general operation of our Board during the year, with a promise of continuing support. These grants, coming at a time of rapid expansion and increasing need for services, have been a very timely assistance. We are most grateful for this help.

In assessing our accomplishments for the year we acknowledge help from many sources. Provincial and University of Alberta officials have been generous with technical assistance. City Commissioners and almost every City department have given willing help in solving many diverse problems.

Finally, your staff wishes to thank the members of the Board for their friendly and co-operative attitude which has lent a good deal of encouragement to our health workers.

Respectfully submitted,

G. M. LITTLE,
MEDICAL HEALTH OFFICER.

C—Cases. D—Deaths.

Communicable disease was responsible for 35 or 2.7% of the 1,266 city deaths during 1952.

Of the 35 deaths, 26 were over 20 years of age. 13 deaths were due to all types of Tuberculosis, and 7 were due to Poliomyelitis. 2 died from Syphilis.

33.2% or 2,194 cases of communicable disease were Chickenpox; Scarlet Fever accounted for 21.8%; Whooping Cough cases were 2.9% and Poliomyelitis was 95 or 1.6%.

SCHOOL HEALTH SERVICES

On April 1st, 1952, the Health Services of the Public and Separate schools were placed under the administration of the Local Board of Health. A uniform service is now given all schools in the city. There has been an overall increase in these services, and a full-time physician, two nurses and a dental hygienist were added to the previous staffs.

Modification of the broad scheme of the service has been effected in conformation with the recommendation of the Provincial Board of Health. This permits an increased amount of the medical officers' attention being applied to those children who show some physical or mental deviation from normal.

Examination by eye specialists, with necessary glasses, were provided for 41 children. Milk was supplied as a necessary nutritional adjunct to certain children. These are welfare services provided to the children of indigent parents.

The response to protective inoculation of the school group was excellent, and for the convenience of parents many pre-school children were also protected at the same clinics.

A most pressing widespread problem is undoubtedly the poor dental health of the average school child. The average consumption of sugar in the last forty years has risen from 15 pounds to 140 pounds per annum. Furthermore, despite all efforts, it is likely that this high sugar consumption will persist. The report of our school dentist for 1952 showed 79% of the children in Grades 2 to 6 with defective teeth. This persistent problem concerns not only the children, but also the adult citizens since poor dental health in the child predisposes to poor dental health in the adult. It follows, therefore, that every proven means at our command—dental supervision, dental education, and fluoridation of water supplies—should be applied energetically to combat this formidable problem.

Complete Physical Examinations

Number reported with defects	3,129
Number of pupils non-defective	5,572
Total	8,701
Parents present at Complete Physical	5,530
Parents invited to Complete Physical	7,785

Medical Inspection by Nurses
